A diver in a dark, green-tinted underwater environment. The diver is positioned horizontally, facing left, with their arms and legs extended. The water is murky and green, with some light rays visible. The overall atmosphere is mysterious and somber.

THE CALL

OF THE ICE

The Call of the Ice

We continue to learn different calls on the planet, mostly related to the Ocean. This time, our attention was attracted by the Call of Ice.

Ocean has a great variety of different calls.

The most habitual to us are the call of the beach,

...the call of fishing,

... well, or the call of sea voyages.

There are more rare calls like, for example, the call of coastal somersaults,

... or low-tide treasure hunting.

There are also the call of legends, for instance, the call of sea dandelion.

*(Many dandelion lovers, by the way, believe
in it very much)*

*However, in this book, we will tell you in detail
about a different kind of call.*

It is called ...

... the Call of the Ice.

What kind of call is it and why does ice attract us at all?

*Because, to be honest, ice does not seem to be the
coziest place to live on the planet.*

*However, here, everything can be explained very easily.
The cause of this call - are the polar magic eggs. They
are its strong source.*

If this call didn't exist, who would leave the warm seas?

However, in reality, divers with good hearing cannot resist this call. It is good that, at least, magic polar eggs can be found there.

There are many legends about what can be done with the help of these eggs. For instance, these eggs can make blue icebergs,

...erect ice walls and even...

*...sculpt
clouds.*

*However, it is very difficult to reach polar eggs.
The way to them is blocked by the high walls of
the icebergs,*

...and as for the nests with eggs, they are guarded by the ruthless polar egg-furies.

But anyway, it doesn't frighten real divers-seekers. The Call of the Ice is stronger for them, than all the dangers.

This is the main about the Ice. Well, also that ices are interesting...

...because, for instance, they can be viewed from different angles.

This gradually develops a philosophical vision of the world for observers. A useful thing, by the way...

Oh, yes! We also did an experiment on the locals. We wanted to find out whether they live here because of the call of the polar eggs or according to their own will.

We put earplugs in a penguin's ears so that he would not hear any calls. The result turned out to be quite interesting. The first thing the penguin did after that -

...

...darting toward the warm Madagascar.

*Well, that is all that we succeeded to find
about this unusual call - the Call of the Ice.*
